~~State of the art~~

The NK-2 receptor of tachykinins is widely expressed in the peripheral nervous system of mammals. One of the various effects produced by the selective stimulation of the NK-2 receptor is the contraction of smooth muscle. Hence antagonists of the NK-2 receptor may be considered agents capable of controlling excessive contraction of smooth muscle in any pathological condition in which the release of tachykinins concurs in the genesis of the corresponding disorder.

In particular, the bronchospastic and inflammatory component of asthma, coughing, pulmonary irritation, intestinal spasms, spasms of the biliary tract, local spasms of the bladder and of the ureter during cystitis, kidney infections and colics may be considered conditions in which the administration of NK-2 antagonists may be effective (E.M. Kudlacz *et al.*, Eur. J. Pharmacol., 1993, 241, 17-25).

In addition, a number of NK-2 antagonists capable of surmounting the haemato-encephalic barrier have shown anxiolytic properties (D.M. Walsh *et al.*, Psychopharmacology, 1995, 121, 186-191).

Cyclic compounds, and in particular cyclic hexapeptides (A.T. McKnight *et al.*, Br. J. Pharmacol., 1991, 104, 355) and bicyclic hexapeptides (V. Pavone *et al.*, WO 93/212227) or cyclic hexapseudopeptides (L. Quartara *et al.*, J. Med. Chem., 1994, 37, 3630; S.L. Harbeson *et al.*, Peptides, Chemistry and Biology. Proceedings of the Twelfth American Peptide Symposium, 1992, 124) are known in the literature for their antagonistic activity towards the NK-2 receptor

of tachykinins. In EP-A-333174 linear di-and tri-peptide compounds comprising the -D-Trp-Phe-moiety are described; such compounds possess tachykinin antagonism.

AMENDED SHEET

It has now surprisingly been found that products of lower molecular weight, monocyclic ones, containing only four bifunctional residues linked together via peptide or pseudopeptide bond, present high pharmacological activity associated to a considerable selectivity for the human NK-2 receptor, and thus

5 are proposed as valid alternatives.

Detailed description of the invention

The present invention therefore sets itself the aim of making available new monocyclic compounds containing four bifunctional residues linked together via peptide or pseudopeptide bonds having antagonistic action on the NK-2

Pharmaceutically acceptable salts of compounds of formula (I) include the salts with inorganic acids (such as, hydrochloric acid, hydrobromic acid, hydrogen iodide, sulphuric acid, nitric acid, phosphoric acid) and organic acids (such as, acetic, propionic, succinic, malonic, citric, tartaric, metasulphonic, *para*-toluenesulphonic acids), as well as salts of pharmaceutically acceptable bases, both inorganic (such as, hydroxides of sodium, potassium, calcium,

30

magnesium, zinc and aluminium) and organic bases (such as, amines like methyl amine, diethyl amine, triethyl amine, ethyl amine, tromethamine or piperidine).

According to the invention, the compounds of formula (I) containing peptide or
5 pseudopeptide bonds may be obtained by means of classical condensation
methods using techniques known in the literature. The general method chosen
by us for preparing the peptide compounds ($X_1-X_4 = -CONR-$, $-NRCO-$) involves
the synthesis in solution of the linear peptide chain using amino acids,
dicarboxyl or diamine derivatives suitably protected and, after selective
10 deprotection of the C- and N-terminals, cyclization in polar organic solvents in
diluted solution. As method of activation of the carboxyl groups, that using
PyBOP and DIEA in DMF or HBT and EDC in DMF are generally preferred.

~~To provide an example, the attached diagram presents the general synthesis of
compounds of formula (I) in which $X_1 = X_2 = X_3 = X_4 = -CONH-$.~~

15 The dicarboxyl precursors 7 containing the R_4 group, and the diamine
precursors 4 containing the R_3 and R_7 groups were prepared using methods
described in the literature.

In particular, the synthesis of the succinic derivatives, with $R_4 = \text{alkyl}$ or $(CH_2)_n-$
Ar, is described by R. Conrow *et al.*, J. Org. Chem., 1986, 51, 938 and by S.G.
20 Cohen *et al.*, J. Am. Chem. Soc., 1968, 90, 3495, whilst in the case of $R_4 = H$,
amine group, hydroxyl group or carboxyl group, the following were respectively
used: succinic anhydride, aspartic acid, malic acid or carboxysuccinic acid
appropriately protected.

The synthesis of the ethylene diamine derivatives containing the R_3 , R_7 groups
25 was performed starting from the corresponding N-protected amino acids by
reduction of the carboxyl to alcohol with BH_3 .THF (C.F. Stanfield *et al.*, J. Org.
Chem., 1981, 46, 4797, 4799; I.R. Ollmann *et al.*, Bioorg. Med. Chem., 1995, 3,
969), conversion to azide via the corresponding mesylate and subsequent
reduction to amino group (P.G. Mattingly, Synthesis, 1990, 366; P.M. O'Brien *et*
30 *al.*, J. Med. Chem., 1994, 37, 1810).

The compounds containing reduced peptide bonds ($X_1-X_4 = -CH_2-NR-$, $-NR-$
 $-CH_2-$) were synthesized in solution according to known methods, such as

0932210.071200
0932210.071200

reductive amination of the aldehyde of an amino acid with the amine function of a protected amino acid or peptide, in the presence of NaCNBH_4 as reducer in DMF/AcOH (K.A. Jacobson *et al.*, J. Med. Chem., 1983, 26, 492; R.F. Borch *et al.*, J. Am. Chem. Soc., 1971, 93, 2897; J.P. Salvi *et al.*, Tetr. Lett., 1994, 35, 1181). The aldehydes were obtained by reduction with LiAlH_4 of the
5 corresponding protected amino acids, N,O-dimethylhydroxy-amates according to the method described by J.A. Feherentz *et al.*, Synthesis, 1983, 676 and Int. J. Peptide Res., 1985, 26, 236.

The compounds of formula 10 wherein R_4 is NH_2 or COOH can be derivatized
10 into compounds of formula 1 wherein R_4 is NR_9R_{10} , guanidine, tetrazole, NHCOR_8 , CONHR_8 , COOR_{17} , CONHR_{12} , wherein R_9 , R_{10} , R_8 , R_{12} and R_{17} are as above defined, according to known methods.

The compounds of formula (I) as specified above have proved to be powerful antagonists of the NK-2 receptor of tachykinins, and hence can be administered
15 as agents capable of controlling any central or peripheral manifestation due to excessive activation of tachykinergic neurons, and in particular excessive contraction of smooth muscle in any pathological condition in which release of tachykinins concurs in the genesis of the corresponding disorders.

In particular, the bronchospastic and inflammatory component of asthma, of
20 coughing, of pulmonary irritation, intestinal spasms, spasms of the biliary tract, and local spasms of the bladder and ureter in the course of cystitis and kidney infections and colics may be considered conditions in which the administration of the compounds of formula (I), as NK-2 antagonists, may prove effective.

The use as anxiolytic agents should also be considered for those compounds
25 that are provided with the appropriate chemico-physical characteristics for penetration into the CNS.

The compounds of formula (I) that are the subject of the present invention are suited for administration for therapeutic purposes to higher animals and man through the parenteral, oral, inhalational and sublingual routes, achieving
30 pharmacological effects according to the properties described above. For administration through parenteral (intravenous, intramuscular, and intradermal) routes, sterile or lyophilized preparations are used. As far as the nasal,

inhalational and sublingual instillation routes are concerned, aqueous solutions, aerosol preparations, powders or capsules are used according to the particular case.

The doses of active principle in the aforesaid compositions may range between
5 0.02 and 10 mg/kg of body weight.

The invention will now be illustrated in the examples that follow, which, however, have no limiting effect.

Biological activity

The compounds described in the present invention act as antagonists of the NK-2 receptor of tachykinins. The biological activity was evaluated in two *in-vitro* functional tests, using rabbit pulmonary artery (RPA) and hamster trachea
10 (HT), according to the methods described by C.A. Maggi *et al.*, Br. J. Pharmacol., 1990, 100, 588 and P. D'Orléans-Juste *et al.*, Eur. J. Pharmacol., 1986, 125, 37. The activity of the compounds as human NK-2 receptor antagonists was assessed in a binding test using membranes of Chinese hamster ovary (CHO) cells, transfected with the NK-2 receptor of human ileum
15 and the radioligand [¹²⁵I]NKA (Amersham, specific activity 2000 Ci/mmol) at a concentration of 100 pM in competition studies. The substances under examination were tested in a concentration range of from 0.01 nM to 10 mM. At the end of incubation (30 minutes at 20°C), the samples were filtered on Whatman GF/B filters and employing the Brandel automatic filtration system.
20 Radio-activity was determined by means of a gamma counter (Cobra, Canberra Packard).

The data gathered from the functional studies were expressed as pA₂ (O. Arunlakshana and H.O. Schild, Br. J. Pharmacol. Chemother., 1959, 14, 48), and those of the binding studies as pKi (-log Ki calculated using the LIGAND
25 programme: P.J. Munson *et al.*, Anal. Biochem., 1980, 107, 220).

The compounds of the invention proved active in the tests referred to above, with pA₂ values of between 5 and 9, the more powerful compounds revealing a higher affinity for the human receptor, with pKi of between 8 and 10.
